

TURN THE HEAT OF HIGH-SPEED MACHINING TO YOUR ADVANTAGE

High-speed machining means you can produce more in less time. Heat at the cutting edge can be tricky to deal with – especially as it can reach 1000°C or more. High-speed machining calls for a clever approach: a fluid that can cool and lubricate in extreme heat without damaging the tool or the workpiece.

Castrol Syntilo delivers the cooling properties of water and transforms into advanced lubrication in the high temperatures generated at the cutting edge. So you protect the life of your tools and deliver the high-quality finish your customers demand – fast.
